Interoperability for Health and Care

2015 Update for Provider and Payer Collaborations

HIMSS Provider-Payer Community – February 27, 2015 HealthTech Net

Joe Bormel, MD, MPH

- Former Medical Director roles with Cerner, QuadraMed and the ONC
- Current Medical Management / Informatic roles with Healthline

Two Minute Interoperability Drill

 "It's been five years and 23 billion taxpayer dollars and we absolutely don't have interoperability. My doctor left his practice last year; I changed to another doctor in the same practice, spent \$50 to get my chart printed out to paper and the new doctor in the same practice has no good way to take this in. In contrast, I've been doing electronic funds transfer on my smart phone."

– Congressional Staffer, January 2015

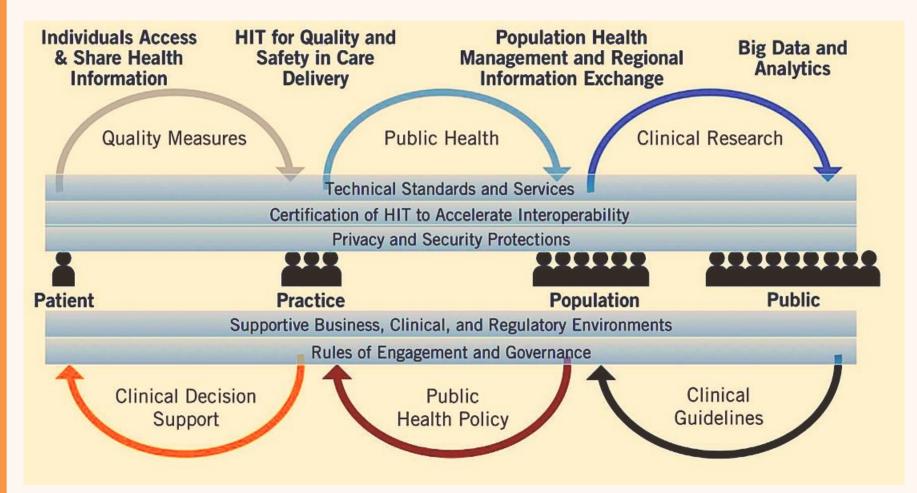

- "It's been..."
 - More than 30 years
 - Electronic health **industry revenue cycle data**, providers \rightarrow payers.
 - In the last five years, through government-coordinated standardization including of clinical codes, standardized exchange, and payment reform,
 - more than 90% of EH and EP attested capability to
 - send and receive electronic visit summary information
 - The current visit and not the complete chart.
 - We have reached critical mass."
 - Data-driven case, January 2015

Two Minute Interoperability Drill

What's missing in the first story?

- Market Behavior
- Denominators

Ten Year Vision The Learning Health System

Learning Objectives

Challenge

 Understand current healthcare challenges, as they relate to the interoperable exchange of health information between consumers, providers and payers, while maintaining semantic integrity

• Themes

 Understand those challenges and goals in terms of industry and government policy model and framework

• Framework

 Connect the current need to deliver care efficiently with competitive quality, with care transformation under ACA

Agenda

Part One: Interoperability Concepts Defined

Part Two: Implications for Provider and Payer Collaborations

Context modeling

- "The real challenge is to "say the right thing at the right time in the right way." This is possible only with computational environments that take the user's context into account."
 - What the users are doing?
 - What they have done?
 - Where they are?
 - What they know?

...

Fischer G & Ostwald J. Knowledge Management: Problems, Promises, Realities, and Challenges. IEEE Intelligent Systems, January/February 2001, 60-72, 2001.

Interoperability Example: Heart Failure Context

• Traditional Revenue Cycle Context – What CFO needs to know

Base MS-DRG	Base MS-DRG Description	IPPS Cases	ALOS	_	Average Payment		Case Mix Index
293-292-291	Heart failure & shock	230	4.8000	\$71,913	\$10,694	\$14,950	1.1598
195-194-193	Simple pneumonia & pleurisy	188	5.5479	\$74,320	\$10,160	\$14,795	1.0711
872-871	Septicemia or severe sepsis w/o MV 96+ hours	179	6.9832	\$105,207	\$15,668	\$21,331	1.6067
470-469	Major joint replacement or reattachment of lower extremity	127	3.7874	\$108,116	\$19,658	\$22,727	2.0582

Clinical Context --- What CMO needs their providers to know

how was it diagnosed, what is the current EF, what is the status of the coronary arteries, what is the medication regimen (what has and has not worked), who is the cardiologist (if there is one), when was the last cardiology visit, what is the ideal weight, etc.

Interoperability Definitions

Simple

The transport and effective use of things, from one party to another. Things are information, electrical plugs, cell phones, services (e.g. APIs) and commercial services (e.g. Uber Ride Sharing, Flywheel, Lyft).

• ONC

- IEEE definition "the ability of two or more systems or components to **exchange** information and to **use** that exchanged information"
- − "Exchange and Use" \rightarrow "Collect, Share, Use"
- Ease: "without special efforts on the part of the customer"

Interoperability Metaphors

- Comparative
 - Railroad Specifications
 - Cell Phones / Networks
 - International Electrical Plugs
 - "Public" APIs (see JASON Task Force)
 - Hailing any cab from any smartphone
- Valuation Thinking
 - Standardize the platform and don't build
 - Glass
 - Half-Full versus Half-Empty
 - Value of the milk in the glass

Interoperability May mean different things:

Interoperability

From Wikipedia, the free encyclopedia

Interoperability is the ability of making systems and organizations work together (inter-operate). While the term was initially defined for information technology or systems engineering services to allow for information exchange,^[1] a more broad definition takes into account social, political, and organizational factors that impact system to system performance.^[2]Task of building coherent services for users when the individual components are technically different and manage by different organizations^[3]

- 11 Public safety

The HIMSS & Board approved the following definition of interoperability on April 5, 2013:

In healthcare, interoperability is the ability of different information technology systems and software applications to communicate, exchange data, and use the information that has been exchanged. Data exchange schema and standards should permit data to be shared across clinicians, lab, hospital, pharmacy, and patient regardless of the application or application vendor. Interoperability means the ability of health information systems to work together within and across organizational boundaries in order to advance the effective delivery of healthcare for individuals and communities. There are three levels of health information technology interoperability: 1) Foundational; 2) Structural; and 3) Semantic.^[12]

ONC Concept Paper - June 2014

The Office of the National Coordinator for Health Information Technology

Connecting Health and Care for the Nation: A 10-Year Vision to Achieve an

Interoperable Health IT Infrastructure

Three-Year Agenda: Send, Receive, Find, and Use Health Information to Improve Health Care Quality

Overview

The U.S. Department of Health and Human Services (HHS) has a critical responsibility to advance connectivity of electronic health information and interoperability of health information technology (health IT). This is consistent with its mission to protect the health of all Americans and provide essential human services, especially for those who are least able to help themselves. This work has become particularly urgent with the need to address the national priority of better and more affordable health care, lead to better population health. Achieving this goal will only be possible with a strong, flexible health IT ecosystem that can appropriately support transparency and decision-making, reduce redundancy, payment reform, and help to transform care into a model that enhances access and truly addresse health beyond the confines of the health care system. Such an infrastructure will support more efficience and effective systems, scientific advancement, and lead to a continuously improving health system empowers individuals, customizes treatment, and accelerates cure of disease.

In the past decade, there has been dramatic progress in building the foundation of a health IT infrastructure across the country that is resilient and flexible to accommodate many types of cha Through deliberate policy and programmatic action, the majority of meaningful use¹ eligible hospitals and professionals have adopted and are meaningfully using health IT. This progress has laid a strong base upon which we can build. However, there is much work to do to see that every individual and their care providers can get the health information they need in an electronic format when and how they need it to make care convenient and well-coordinated and allow for improvements in overall health. There is no better time than now to renew our focus on a nationwide, interoperable health IT infrastructure – one in which all individuals, their families, and their health care provide have appropriate access to health information that facilitates informed decision-making, support

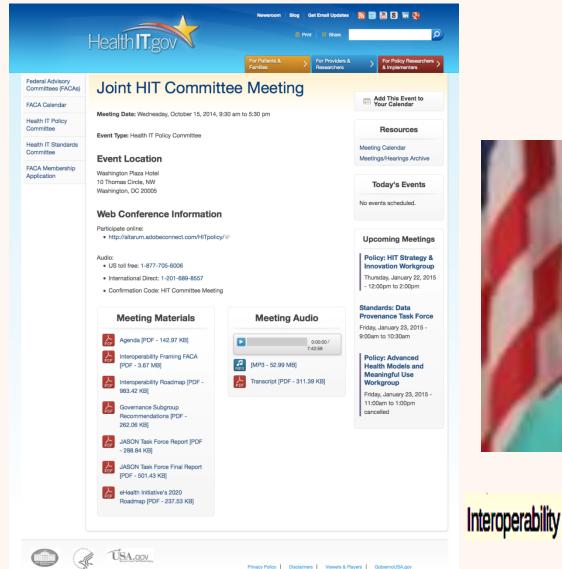

¹ Formally referred to as the Medicare and Medicaid EHR Incentive Programs

Connecting Health and Care for the Nation: A Ten Year Vision to Achieve Interoperable Health IT Infrastructure Six-Year Agenda: Use Information to Improve Health Care Quality and Lower Cost

Five Building Blocks

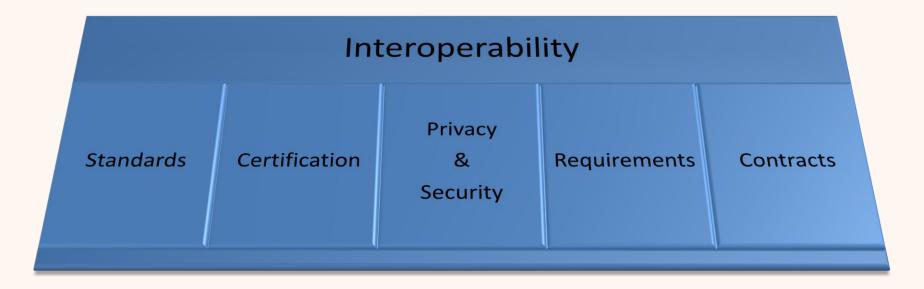

How will we get there?

It will take a strategic and focused effort by the federal government, in collaboration with state, tribal, and local governments and the private sector. We will aim to develop a shared agenda that focuses on five critical building blocks for a nationwide interoperable health information infrastructure:

- 1. Core technical standards and functions
- 2. Certification to support adoption and optimization of health IT products and services
- 3. Privacy and security protections for health information
- 4. Supportive business, clinical, cultural, and regulatory environments
- 5. Rules of engagement and governance

These building blocks are interdependent and progress must be incremental across all of them over the next decade to realize this vision. We will develop a more comprehensive set of use cases and goals for three, six and ten-year timeframes that will guide work in each of the building blocks, including alignment and coordination of prioritized federal, state, tribal, local, and private sector actions.

Five Building Blocks

What Do The Standards Look Like?

Standards Defined in the Certification Criteria		rds Use the e EHR	ed				andaro Set El				ts							d in th mpone	
Code of Federal Regulation Number Crosswalk Reference to the Applicable Standard, Grouped by Standard Category* "NOTE - In this table when a standard is referenced only by the Code of Federal Regulation number in another standard, for ease of reading, the Advisory Board has added the standard name or explanation in bold blue font. The red font indicates a change from the NPRM in this column and a delete standard in the final rule. Agenda

Part One: Interoperability Concepts Defined

Part Two: Implications for Provider and Payer Collaborations

Where Does This Leave Providers and Payers?

In summary so far:

- Progress
- Programs
- Data Limitations
- Data Processing
- People
- Unprecedented Change

Providers and Payers don't have the option of managing the existing system or standing still

"We must live by the 3 foot rule"

"One can't simply manage an existing system, for the unstable environment continually threatens to render any given structure and set of policies out of synch with its demands and opportunities."

Peter B. Vaill, Managing as a Performing Art, Jossey-Bass, Inc. 1989

Interoperability at 3 Feet

Consumer Price Transparency – WellMatch Health

https://www.wellmatchhealth.com/

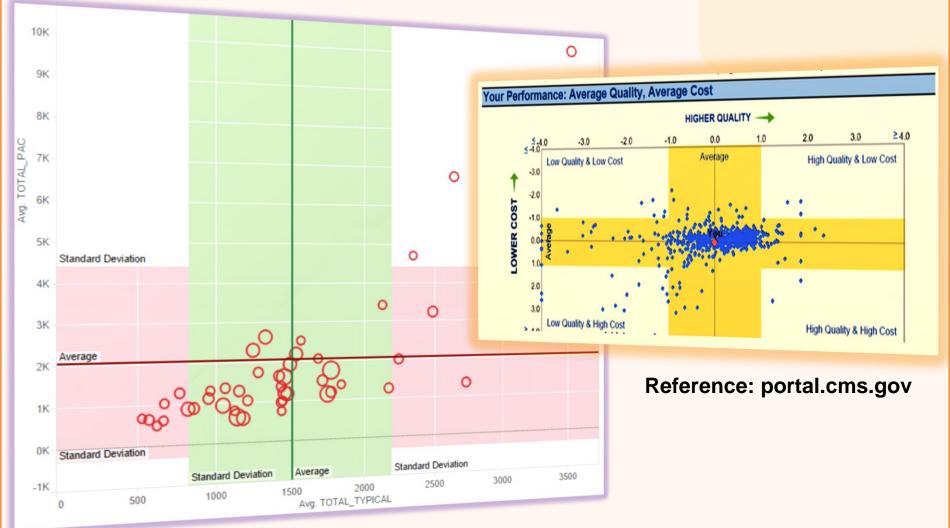

- Cost and Complications, resulting from the transparency created by interoperability create increased need to understand and track costs, quality and access, by both providers and payers.
- The Weather context problem: Varying contexts can make summarizing and interpreting price data both powerful and, in some cases, misleading.
- "Race to the bottom" and data quality requires heightened vigilance

Claims + EHR – Multiple Provider/Payer initiatives to improve longitudinal views and improve coding specificity

- Improving clinical data capture and reporting, to improve transitions of care, ICD-9/10 specificity and reimbursement under HCC code is greatly aided by interoperable systems and standards
- New, unproven workflows are required (Med Rec was easy?)

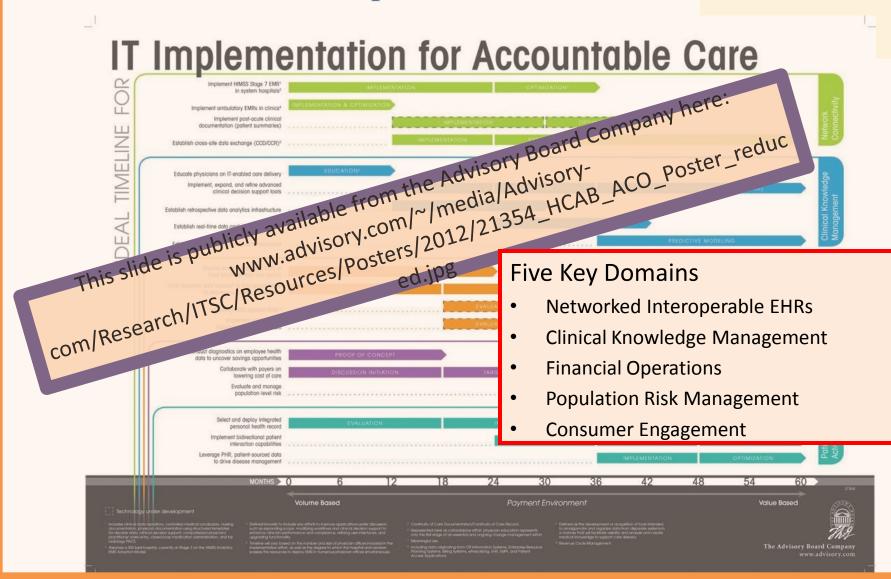

Interoperability

Transparency: Clinical Opportunity and Risk:

Interoperability at 3 Feet *examples*

74

5 Key Domains and 5 Building Blocks, Simultaneous Motion

Advances in interoperability require management oversight and program coordination that wasn't previously necessary or possible.

Five Building Blocks of Interoperability

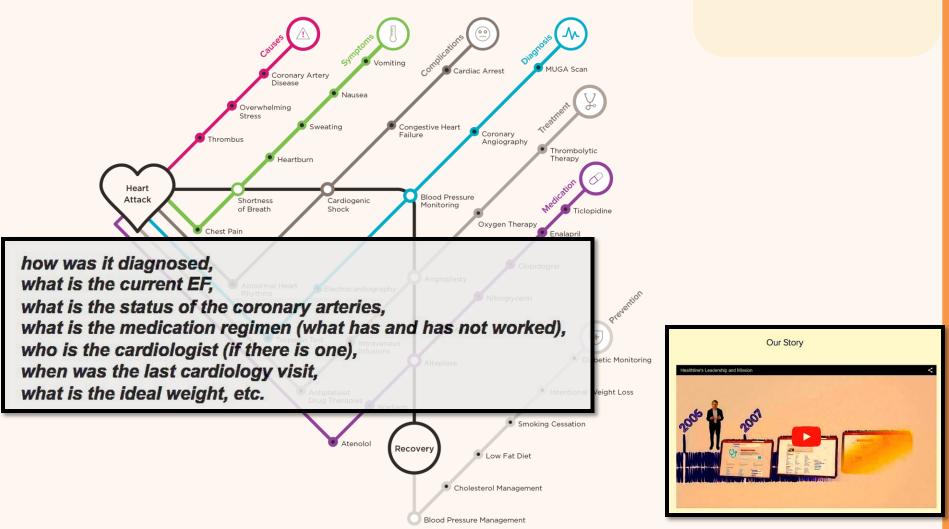

- Standards
- Certification
- Privacy & Security
- Requirements
- Contracts

Five Key Domains

- Networked Interoperable EHRs
- Clinical Knowledge Management
- Financial Operations
- Population Risk Management
- Consumer Engagement

Bridging The Domains

Clinical Summarization using Healthcare Taxonomies Mapping Semantic Relationships, From Curated Knowledge Bases

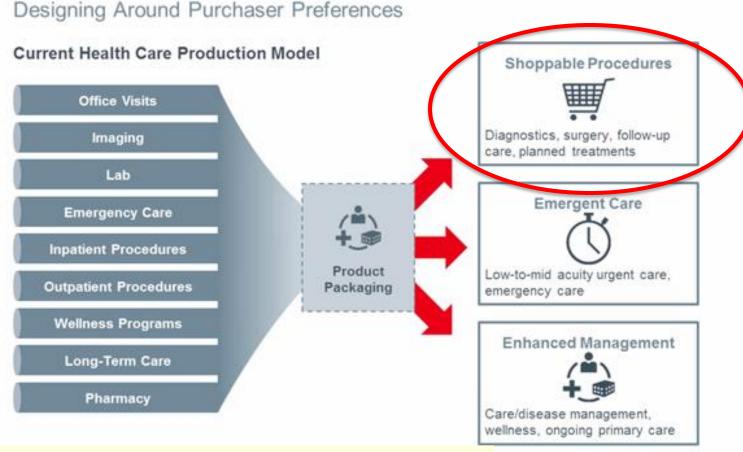

See 'Our Story' at http://corp.healthline.com/about-us/ for more information

Interoperability – Analytics:

(Materials drawn from a January 2015 webinar from The Advisory Board Company – Health Care IT Advisor, by director Jim Adams - <u>http://www.advisory.com/expert-directory/jim-</u> adams) Advisory Board Company Health Care IT Advisor

Overview of the Health Care Analytics Market BI Needs Outpace Vendor Tools and Health-Care Organizations' Capabilities

From Individual Inputs to Consumer Products

From January 2015 webinar from The Advisory Board Company – Health Care IT Advisor, by director Jim Adams http://www.advisory.com/expert-directory/jim-adams)

Use Deliberate Criteria to Choose Your BI Approach

Match the Approach to Your Organization's Strengths and Goals

Hazards with Interoperability

- Not new
- Economic model
- Asymmetrical risk assumption
- Trust
- Address process
- Identify risks in interoperability and address/mitigate
- In all communications, the context of the listener is the key

Discussion Interoperability for Health and Care 2015 Update for Provider and Payer Collaborations
