

Morphine, Magic and RUM

Keys to improving healthcare data use to
achieve the triple aim

Joe Bormel, MD, MPH

*Former ONC Director of Health Outcomes
and EHR vendor VP/CMO*

June, 2014

Stress-Free Productivity

Take home messages:

Usability is important

ARRA/HITECH relies on it

ACA relies on it

Usability depends on culverts

MU Certification and Attestation processes
delayed or deferred investment in usability; so did
implementation timelines

Here's hope.

Effortless Task Completion

The BIG Picture

Usability Defined

Usability is "the extent to which a product can be **used by specified users to achieve specified goals** with effectiveness, efficiency and satisfaction in a **specified context of use**"

ISO 9241

A Universal Healthcare Challenge

- IHI Forum December 2009
 - IHI Improvement Map lists Core Healthcare Processes
- Red push pins = most severely broken processes
- Silver push pins = CPI successes
- Med Rec
- Only one 'possible best practice' noted: "One Patient: One List"
- Hospitals revert to paper processes : Don't try it in vapor 'til you can do it on paper!
- No helpful hints

One hospital's conclusion: We are not alone!
Medication Reconciliation is *the right thing to do...*
but how?

What Are the Most Common Causes of Abdominal Pain?

Whether it's a mild **stomach** ache, sharp pain, or stomach cramps, abdominal pain can have numerous causes. Some of the more common causes include:

- ❖ Indigestion
- ❖ Constipation
- ❖ Stomach virus
- ❖ Menstrual cramps
- ❖ Food poisoning
- ❖ Food allergies
- ❖ Gas
- ❖ Lactose intolerance
- ❖ Ulcers
- ❖ Pelvic inflammatory disease
- ❖ Hernia
- ❖ Gallstones
- ❖ Kidney stones
- ❖ Endometriosis

What Are the Most Common Causes of Abdominal Pain?

Impact

Conclusion: Cognitive support of medication reconciliation through interface design can significantly improve performance and safety.

FASTER - statistically significantly **faster** (211s vs 293s),

EASIER - requiring **fewer clicks** (47 vs 84) and scrolls (146 vs 549)

MORE RELIABLE

LESS SERIOUS ERRORS - **Serious errors** occurred (12 vs 31)

HIGHER USER SATISFACTION

“The **staged animation** helped clarify the steps in medication reconciliation making it valuable ...”

Culvert Thinking is Key

- Models of Care, Payment and workflow
 - visualization and task serialization example (not shown)
 - Using Microsoft Outlook more effectively
-
- Self-checkout at Grocery Store
-
- Elevators

Reliable

Is available and accurate

Functional (Useful)

Works as programmed

Focused on
Tasks
(Products, Features)

OBJECTIVE / QUANTIFIABLE

Key to Improving Usability

Example: Medication Reconciliation

- ❖ Start with definition: ‘... specific user, specific task, specific context, specific expected result...’
 - ❖ write down a narrow definition of that user, task and context, e.g. triage nurse, triage, presentation to ED, completion or documented classification
- ❖ Homework first: If someone else has figured out “what is wanted, needed, and possible,” start with that {artifact: elaboration of options}
 - ❖ e.g. Vickie Kamataris’ Novaces video
- ❖ Homework second: Locally and visibly survey “what people say they do, think they do, and actually do” {artifact: incubate and commit to who will make the decision, be informed, motivators in play, linkage to people/org structure and processes}
 - ❖ e.g. present back to any interested audience what the local local volumes and results of that survey. (Current State)
- ❖ Homework turned in:
 - ❖ e.g. accountable person reports to accountable sponsor the current state and planned dashboard, update frequency, and committed actions, including resilience and key process changes (e.g. complex med profile designation)

Key Process Improvements

Criteria for Complex Medication Profile designation:

1. High-risk Medications: Anticoagulants (Coumadin, Heparin), Insulin, Digoxin
2. Greater than 10 home meds
3. Medication list unknown at admission
4. Patients with diminished LOC
5. Patients with End Organ Failure (CHF, ESRD)

Patients who meet the criteria for Complex Med Profile are assessed and monitored by a Medication Reconciliation Specialist. The Med Rec Specialist is a specially trained RN or Pharmacy Technician.

One Form - the Medication Reconciliation form and functionality within the EMR and other software applications was updated and integrated to simplify and reduce duplicative documentation and to meet the CTQs of end users (physicians and nurses).

The Discharge Med Lists of patients who meet the criteria for Complex Med Profile are reviewed by a Discharge Pharmacist **prior** to discharge..

Providers utilize the hospitalist approach to Med Rec: assume you **don't** know!

The Problem

- Mediation errors are the leading cause of injury to hospitalized patients
- Med Rec is linked to ADEs and poor clinical outcomes
- Readmission rate = 15.4%
- 30-60 minutes of re-work per admission to correct Med Rec discrepancies
- 46% of medication errors occur at admission and discharge
- In a sample of CHF Core Measure HF1d failures (n=68; June 2009), 29.1% were due to Medication Reconciliation discrepancies. Since April of 2008, 100% of CHF Core Measure failures had been due to Medication Reconciliation errors.

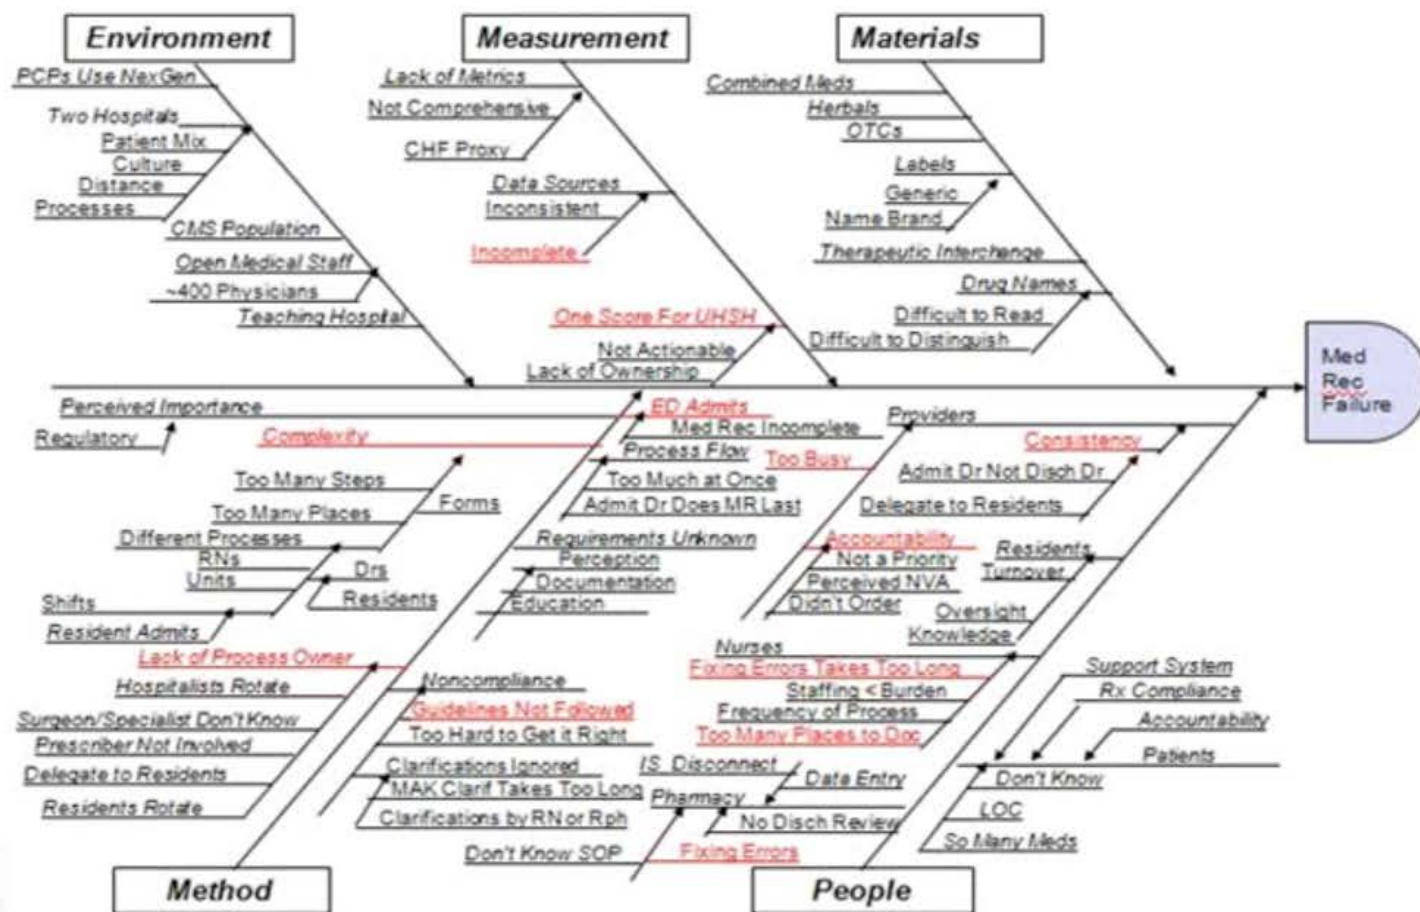

The ProcessVSA had identified and eliminated waste and managed constraints in the CHF Discharge Process. *Impressive Results!*

...But still not good enough.

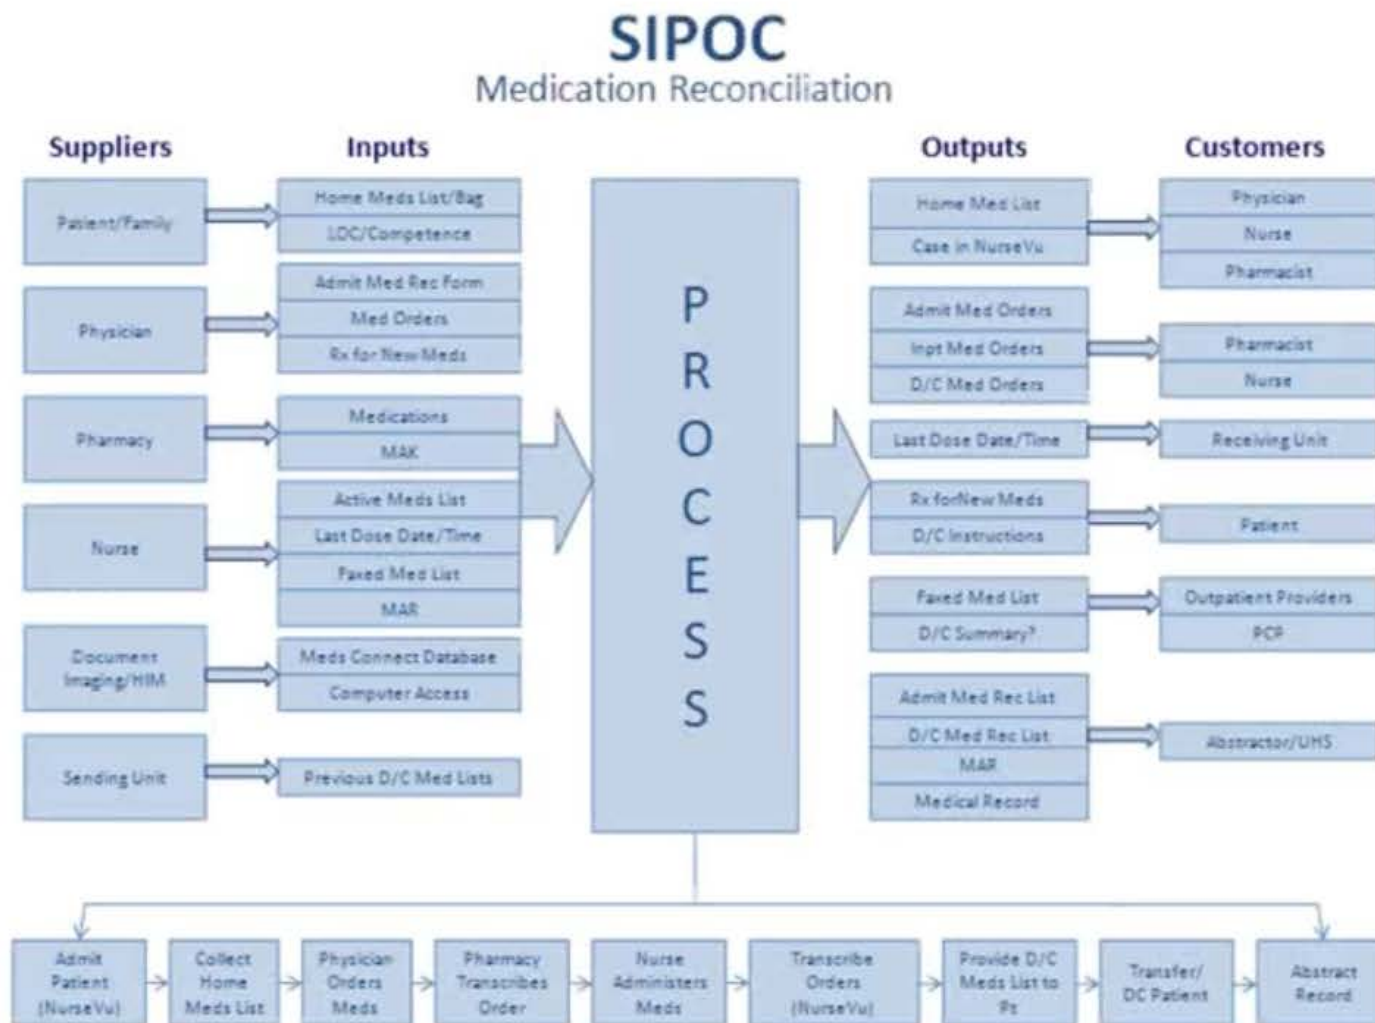

The Six Sigma methodology and toolset was needed to reduce variation and to identify and eliminate the root cause of defects.

Medication Reconciliation: Measure

An Ishikawa or Fishbone Diagram was used to brainstorm and capture potential causes of Medication reconciliation discrepancies:

Medication Reconciliation: Define

A SIPOC focused the team and identified some potential Xs and Ys

From Parking Lot to Front and Center

Inaugural Lean Events:

- #1: CHF Discharge
- #2: Patient Transfer
- #3: ED Critical Labs
- #4: Patient Holds

- For *three out of four* inaugural events, Medication Reconciliation was identified as a significant factor

- Because the opportunity is *defects* and because the scope of the problem is LARGE, Med Rec was relegated to the Parking Lot

Lean Improvements

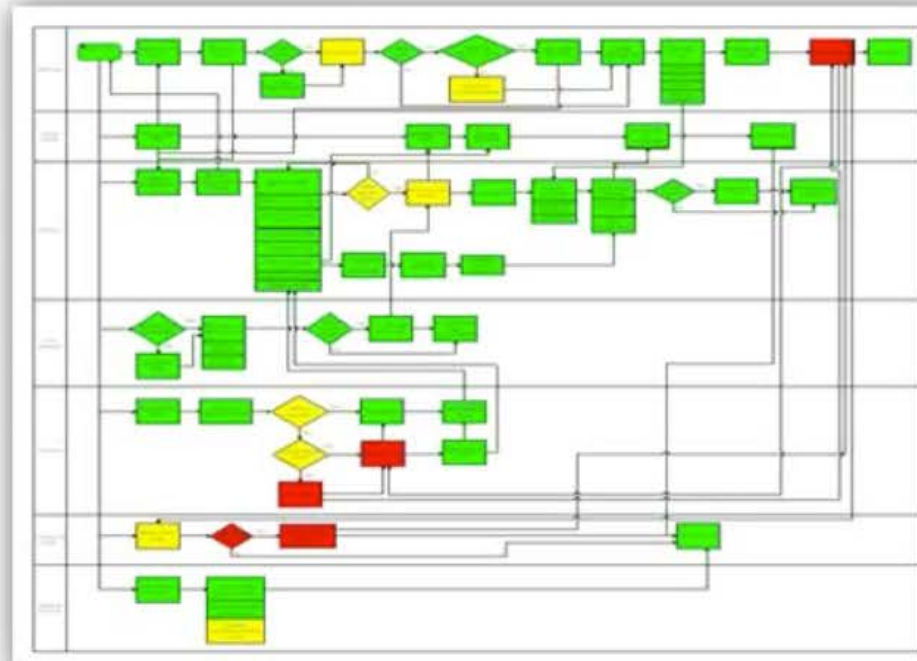

Current State

Total Steps = 99
NVA Steps = 30
Handoffs = 36

Future State

Total Steps = 69
NVA Steps = 5
Handoffs = 21

Know Your Brain, Transform Your Performance

Your Brain at Work

STRATEGIES FOR OVERCOMING
DISTRACTION, REGAINING FOCUS, &
WORKING SMARTER ALL DAY LONG

David Rock

Foreword by Daniel J. Siegel, M.D.

- ### Some Things to Try
- Think of conscious thinking as a precious resource to conserve.
 - Prioritize prioritizing, as it's an energy-intensive activity.
 - Save mental energy for prioritizing by avoiding other high-energy-consuming conscious activities such as dealing with emails.
 - Schedule the most attention-rich tasks when you have a fresh and alert mind.
 - Use the brain to interact with information rather than trying to store information, by creating visuals for complex ideas and by listing projects.
 - Schedule blocks of time for different modes of thinking.

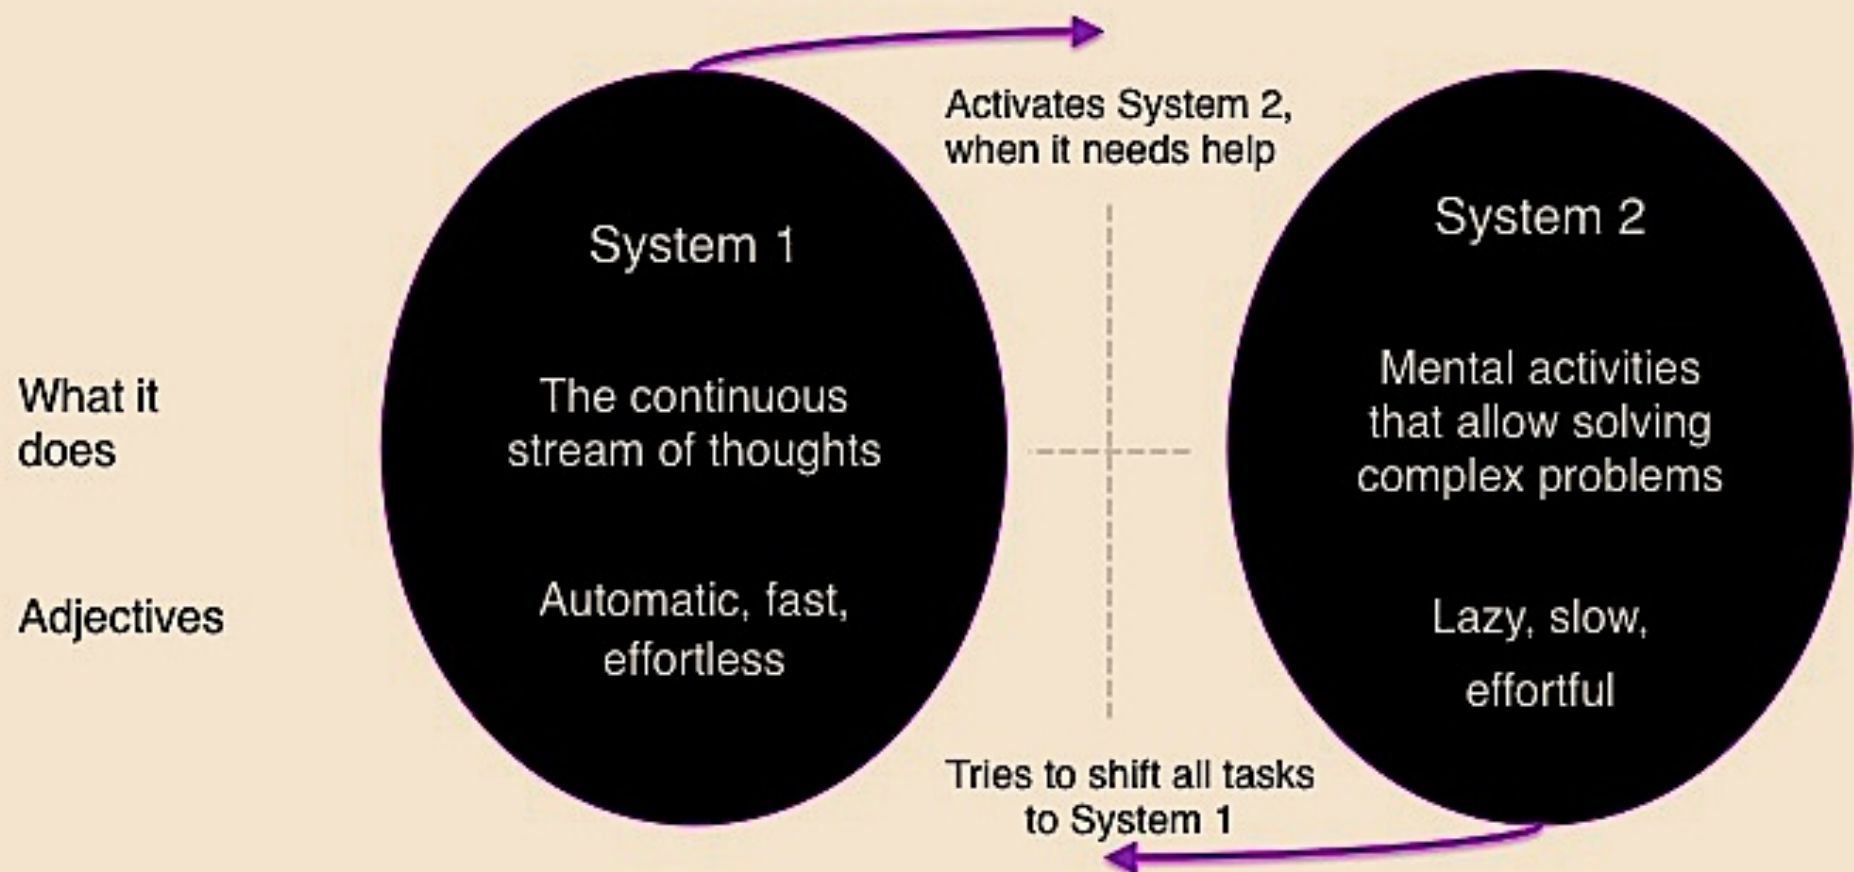

THINKING,
FAST AND SLOW

DANIEL
KAHNEMAN

WINNER OF THE NOBEL PRIZE IN ECONOMICS

Reality can be so complex that equally valid observations from differing perspectives can appear to be contradictory.

PERSPECTIVE

Just remember, whatever side you're on the other person is right too.

"A landmark contribution to humanity's understanding of itself."
—*The New York Times Book Review*

THE RIGHTEOUS MIND

WHY GOOD
PEOPLE ARE DIVIDED
BY POLITICS AND
RELIGION

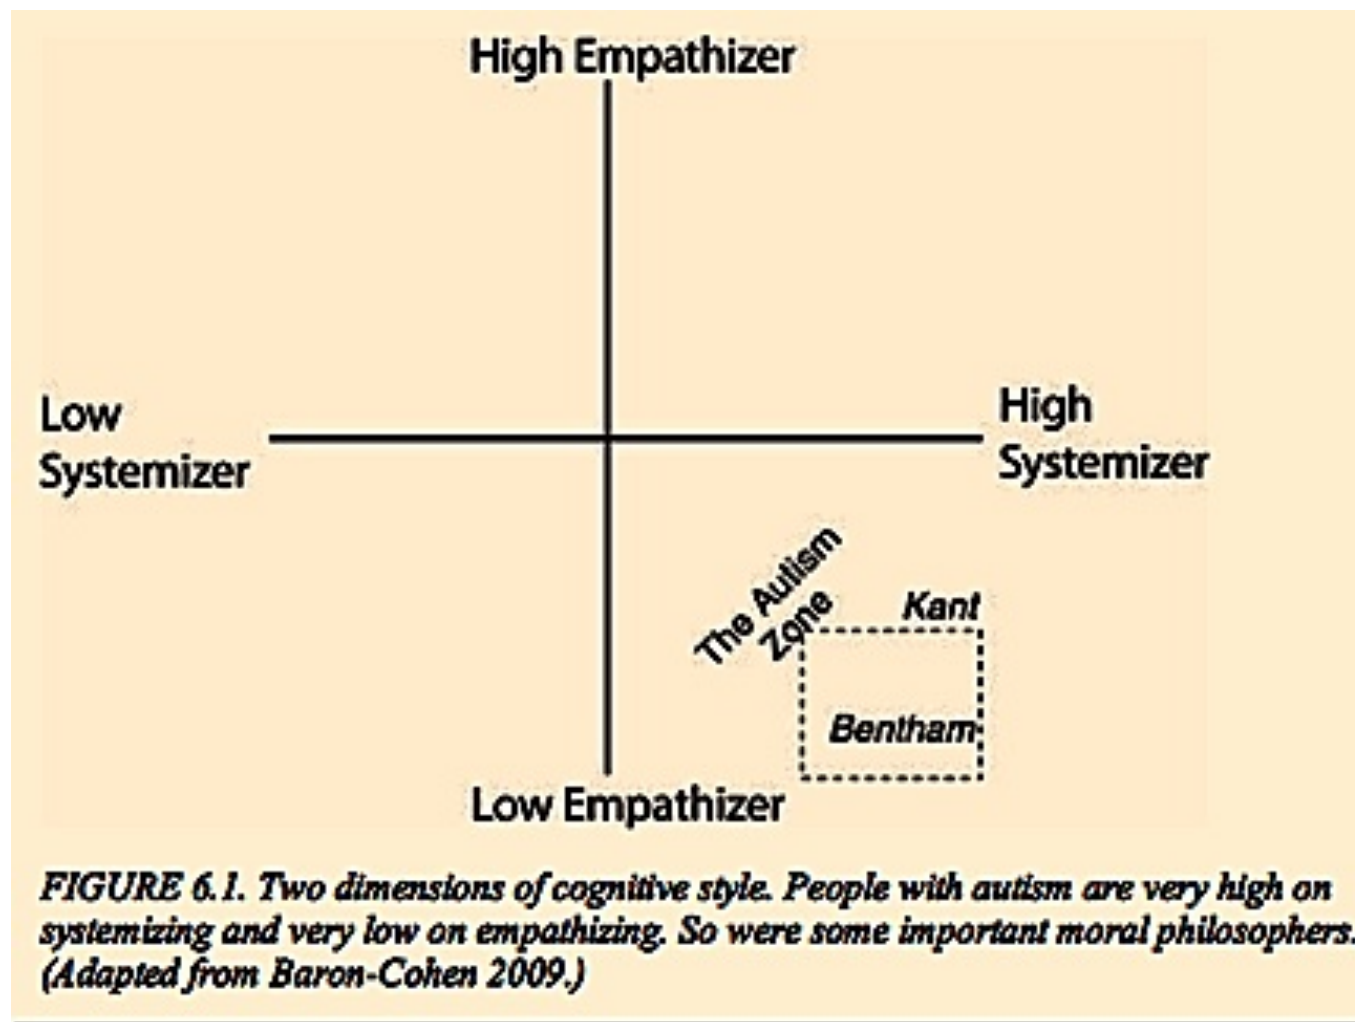

JONATHAN HAIDT

Usability Oriented?

Novelty-seeking genes

People don't adopt their ideologies at random, or by soaking up whatever ideas are around them. People whose genes gave them brains that get a special pleasure from **novelty**, variety, and diversity, while simultaneously being less sensitive to signs of threat, are predisposed

A medium shot of Pharrell Williams. He is wearing a dark green suit jacket over a white collared shirt and a blue and white plaid tie. He is also wearing a dark brown fedora hat. He is looking slightly to his left with a neutral expression. The background is a blurred city street at night, with warm lights from buildings and street lamps creating a bokeh effect.
